

Northwind Analytics - API integration guide
Section 6 - Uploading documents

The supported upload flow has three steps:

1. POST /v2/documents/presign
body: { fileName, contentType, sizeBytes }
returns a presigned PUT URL and a document id.
2. PUT the file bytes to the presigned URL.
3. POST /v2/documents/{id}/complete
verifies size and ETag, then triggers ingestion.

Section 7 - Errors and retries

- 400 malformed request or unsupported file type
- 401 missing or expired access token
- 409 duplicate file name in the knowledge base
- 429 rate limited - retry with backoff
- 5xx transient; the request is safe to retry

Idempotency: every write accepts an Idempotency-Key header. Replaying a key returns the original result.
